MSc Artificial Intelligence

Module: IA_PCOM7E January 2026

Unit 6: Group C – Agentic System Design Proposal Feedback

Grade: 76% (Distinction)

Feedback

Knowledge and understanding of the topic

The report demonstrates a strong understanding of agent-based system design and the application of the Belief–Desire–Intention model within a digital forensics and content moderation context. The proposal clearly explains the system objectives, operational agents, and supporting infrastructure required to support automated detection, processing, and archival of user-generated content. The discussion of agent roles and system components reflects a solid grasp of distributed system design, although further detail on agent reasoning processes and interaction protocols would strengthen the technical depth.

Criticality

The report shows good critical reflection on the advantages and limitations of multi-agent architectures. The discussion of increased system complexity, maintenance overhead, and the need for human oversight demonstrates awareness of practical challenges associated with large-scale automated moderation systems. The analysis could be further strengthened by deeper comparison with alternative architectures or by evaluating how the proposed system would perform under real operational conditions.

Use of relevant sources

The report demonstrates strong use of relevant literature related to agent-based systems, artificial intelligence governance, and automated content moderation. Sources are used to support the architectural design choices and highlight industry practices. Greater synthesis of the literature within the analytical sections would further improve the academic depth of the discussion.

Structure and presentation

The report is clearly organised and follows a logical progression from executive summary to system design, technical implementation, and discussion of limitations. The description of system agents and architectural components is detailed and supported by appendices that present system workflows and diagrams. Minor

improvements in formatting consistency and section transitions would enhance the overall clarity and readability.

Academic integrity

Academic conventions are followed throughout the report with consistent citation of sources and a comprehensive reference list. The work demonstrates a strong attempt to maintain academic integrity and appropriate attribution of ideas. Minor improvements in referencing consistency and formatting would further strengthen adherence to academic writing standards.
